```
opioid receptor gene, comprising a DNA sequence having at least one variation in a fully defined wild-type allele of human kappa opioid receptor (MCOR) sequence appearing as ADN30605, where the variation creceptor (MCOR) sequence appearing as ADN30605, where the variation of comprises CB52T, C948T, C1008T or their combinations. Also included are an isolated nucleic acid molecule selectively hybridising to the variant, as a cloning vector comprising the variant and an origin of replication, an expression vector comprising the variant associated with a promoter, a unicellular host transformed/transfected with the vector and a commercial cet kit for determining the presence of at least one variation in a hKOR gene of an allele in a bodily sample taken from a subject. The hKOR variant allele is useful for determining a susceptibility in a subject to at least one physiological response, condition or disease related to the endogenous opioid system, nociception, neurotransmitter release endogenous opioid system, learning, memory, cognition, pain, cocaine, amphetanine and other stimulants self-administration, behavioural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel isolated variant allele of human kappa opioid receptor gene, useful for determining susceptibility in subject to physiological response, condition or disease related to endogenous opioid system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       determining a therapeutically effective amount of pain reliever to administer to a subject in order to induce analgesia in the subject. The hKOR variant allele is useful for determining a therapeutically effective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sensitisation to cocaine, opiates, alcohol and tobacco, opiate, amphetamine and alcohol withdrawal, physical dependence and tolerance; neuroendocrine function, reproductive function, prolactin regulation, stress responsivity, physiology and pathology of mood and affect, immune function, gastrointesinal function. The hKOR variant allele is useful for determining a susceptibility to pain in a subject and is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      amount of therapeutic agent to administer to a subject suffering from at least one addictive disease. The gene for hKOR is located on chromosome 8q11.2. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated variant allele of a human kappa

                        The present invention describes a vector for delivering an opioid receptor to a nerve cell. The method comprises a sequence encoding an opioid receptor and a vector backbone. Also described: (1) a cell comprising the vector or its integrated product; (2) an animal comprising the cell; (3) reducing pain in a subject; (4) producing the vector or the animal produced by the process of administering the vector to the animal. The vector has analgesic activity, and can be used in gene therapy. The vector is useful in preparing a composition for reducing pain in a subject. The present exequence encodes the human kappa opioid receptor, which is used in the exemplification of the present invention. The human kappa opioid receptor gene is located on chromosome 8, more specifically to 8q11-12.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New vector for delivering an opioid receptor to a nerve cell comprising sequence encoding a mu-opioid receptor and a vector backbone, useful in preparing a composition for reducing pain.

The invention relates to an isolated variant allele of a human kappa opicid receptor gene, comprising a DNA sequence having at least one variation in a fully defined wild-type allele of human kappa opicid receptor (HKOR) sequence appearing as ADN10505, where the variation comprises C8527, C9487, C1008T or their combinations. Also included are an isolated nucleic acid molecule selectively hybridising to the variant a cloning vector comprising the variant and an origin of replication, an expression vector comprising the variant associated with a promoter, a unicellular host transformed/transfected with the vector and a commercial test kit for determining the presence of at least one variation in a hKOR gene of an allele in a bodily sample taken from a subject to wariant allele is useful for determining a susceptibility in a subject to an allele in the proper continuation of these seasons of the sample the proper continuation of the sample the proper continuation of the sample to the continuation of the sample the proper continuation of the sample to the continuation of the sample the proper continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the sample the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of the continuation of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     endogenous opioid system, nociception, neurotransmitter release endogenous opioid system, learning, memory, cognition, pain, cocaine, amphetamine and other stimulants self-administration, behavioural sensitisation to cocaine, opiates, alcohol and tobacco, opiate, amphetamine and alcohol withdrawal, physical dependence and tolerance, neuroendocrine function, reproductive function, prolactin regulation,

stress responsivity, physiology and pathology of mood and affect, immune function, gastrointestinal function. The hKOR variant allele is useful for determining a susceptibility to pain in a subject and is useful for determining a therapeutically effective amount of pain reliever to administer to a subject in order to induce analgesia in the subject. The hKOR variant allele is useful for determining a therapeutically effective amount of therapeutic agent to administer to a subject suffering from at least one addictive disease to treat the at least one addictive disease. The gene for hKOR is located on chromosome 8q11.2. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      300

The invention relates to an isolated variant allele of a human kappa opioid receptor gene, comprising a DNA sequence having at least one variation in a fully defined wild-type allele of human kappa opioid receptor (MCOR) sequence appearing as ADN30505, where the variation of replace (CC comprises CB57T, C348T, C1008T or their combinations. Also included are comprises CB57T, C348T, c1008T or their combinations. Also included are a looking vector comprising the variant and an origin of replication, an expression vector comprising the variant associated with a promoter, a conficular host transformed/transfected with the vector and a commercial est fit for determining the presence of at least one variation in a hKOR contract allele is useful for determining a susceptibility in a subject to at least one physiological response, condition or disease release condogenous opioid system, neciception, neurocransmitter release endogenous opioid system, nearming, memory, cognition, pain, cocaine, amphetamine and other stimulants self-administration, behavioural cocaine, opiates, alcohol and tobacco, opiate, amphetamine and alcohol withdrawal, physical dependence and tolerance; careas responsivity, physiclogy and pathology of mood and affect, immune for determining a susceptibility to pain in a subject and is useful for determining a therapeutically effective amount of pain reliever to determining a therapeutically effective amount of pain reliever to amount of therapeutically effective amount of pain the subject. The kKOR variant allele is useful for determining a therapeutically effective amount of pain the subject in order to induce analgesia in the subject in order to induce analgesia in the subject in amount of therapeutic agent to administer to a subject to administer to a subject to administer to a subject in order to induce analgesia on the present sequence is the sale or kKOR. The gene for kKOR is located on chromosome 8411.2. The present sequence is theadence is the page for kKOR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The inversion relates to an isolated variant allele of a number Kappa optical deceptor gene, comprising ab ADN30505, where the variation of a fully defined wild-type allele of human kappa opicid variation in a fully defined wild-type allele of human kappa opicid ceeptor (hKOR) sequence appearing as ADN30505, where the variation of ceptor of the comprising the variant and an origin of replication, an expression vector comprising the variant and an origin of replication, and expression vector comprising the variant associated with a promoter, a unicellular host transformed/transfected with the vector and a commercial entert in determining the presence of at least one variation in a hKOR gene of an allele in a bodily sample taken from a subject. The hKOR variant allele is useful for determining a susceptibility in a subject to at least one physiological response, condition or disease related to the endogenous opicid system, neciception, neurotransmitter release condogenous opicid system, learning memory, cognition, behavioural sensitisation to cocaine, opiates, alcohol and tobacco, opiate, amphetamine and alcohol withdrawal, physical dependence and tolerance; curvencedocrine function, reproductive function, prolactin regulation, etcress responsivity, physiology and pathology of mood and affect, immune function, gastrointestinal function. The hKOR variant allele is useful for determining a therapeutically effective amount of pain reliever the administer to a subject in order to induce analgesia in the subject. The amount of therapoutic and is useful for determining a therapeutically effective anning annine of thera annine effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

The invention relates to an isolated variant allele of a human kappa opioid receptor gene, comprising a DNA sequence having at least one variation in a fully defined wild-type allele of human kappa opioid receptor (hkOR) sequence appearing as ADN30505, where the variation comprises C852T, C948T, C1008T or their combinations. Also included are a isolated mucleic acid molecule selectively hybridising to the variant, and comprises C852T, C948T, C1008T or their combinations. Also included are comprised comprising the variant and an origin of replication, an expression vector comprising the variant associated with a promoter, a cloning vector comprising the variant associated with a promoter, a conicallular host transformed/transfected with the vector and a commercial cc expression vector comprising the presence of at least one variation in a hKOR can allele in a bodily sample taken from a subject. The hKOR variant allele is useful for determining a susceptibility in a subject to at least one physiological response, condition or disease related to the endogenous opioid system, nectoring, memory, cognition, pain, cocaine, camphetamine and other stimulants self-administration, behavioural centifisation to cocaine, opiates, alcohol and tobacco, opiate, amphetamine and alcohol withdrawal, physical dependence and tolerance; cranscreductive function, prolactin regulation, etc. stress responsivity, physiology and pathology of mood and affect, immune function, gastrointestinal function. The hKOR variant allele is useful for determining a therapeutically effective amount of pain reliever to administer to a subject in order to induce analgesia in the subject. The money manner to a subject in order to induce analgesia in the subject. The manner of the analyse of moder and administer to a subject in order to induce analgesia in the subject. The manner of the analyse of moder and administer to a subject in order to induce analgesia in the subject in a subject in a subject in a subject in subject in a subject in a subject in subj

ADN30511 RESULT

Thu

```
The invention relates to an isolated variant allele of a human kappa

opioid receptor gene, comprising a DNA sequence having at least one

variation in a fully defined wild-type allele of human kappa opioid

receptor (MKOR) sequence appearing as ADNJ0505, where the variation

comprises C852T, C948T, C1008T or their combinations. Also included are

an isolated nucleic acid molecule selectively hybridising to the variant,

a cloning vector comprising the variant and an origin of replication, an

expression vector comprising the variant associated with a promoter, a

unicellular host transformed/transfected with the vector and a commercial

cet kit for determining the presence of at least one variation in a hKOR

cet kit for determining the presence of at least one variation in a hKOR

cet kit for determining a susceptibility in a subject to

at least one physiological response, condition or disease related to the

condogenous opioid system, nociception, memory, cognition, pain, cocaine,

condogenous opioid system, learning, memory, cognition, pain, cocaine,

amphetamine and other stimulants self-administration, behavioural
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated variant allele of human kappa opioid receptor gene, u for determining susceptibility in subject to physiological response, condition or disease related to endogenous opioid system.
                                                                                                                                                                                                                                                                                                                                      Human kappa opioid receptor, hKOR, G36T allele.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Location/Qualifiers

sensitisation to cocaine, opiates, alcohol and tobacco, opiate, amphetamine and alcohol withdrawal, physical dependence and tolerance; neuroendocrine function, reproductive function, prolactin regulation, stress responsivity, physiology and pathology of mood and affect, immune function, gastrointestinal function. The hKOR variant allele is useful for determining a therapeutically effective amount of pain reliever to administer to a subject in order to induce analgesia in the subject. The hKOR variant allele is useful for determining a therapeutically effective amount of therapeutic agent to administer to a subject suffering from at least one addictive disease to treat the at least one addictive disease to treat the at least one additive disease. The gene for hKOR is located on chromosome 8q11.2. The present sequence is the G36T allele of hKOR.

        The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino coids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polyopeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (1) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR. (1) can be used to specific antibody against a particular GPCR, and in the production of specific cartibodies. The peptides are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for CPCRs and antibodies are useful for diagnosing and designing drugs for treating immune-related diseases, growth-related diseases, call regeneration-related diseases, growth-related disease, call regeneration related disease, immunological-related call proliferative diseases, or autoimmune diseases, e.g. AIDS, Alzheimer's disease, catherosclerosis, bacterosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host disease, parkinson's disease, multiple sclerosis, path, psoriasis, cancer, cardiomyopathy, chronic and scute cost sease. Parkinson's disease, multiple sclerosis, path, psoriasis, cancer, cardiomyopathy, chronic and schease, pathma, tuberculosis, obesity, nausea, hypertension, cost disease, theumatoid arthritis, trauma, ulcers, or hypotension, renal disorder, theumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be company given in ABB81675 to ABB2033 to ABZ42869 encode CCC GPCR procession, service in which GPCR are involved, the researt involved in the recent in the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of the content of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         TGCCACCCCGTGAAGGCTTTGGACTTCCGCACACCCTTGAAGGCAAAGATCATATC 540
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present relates to a method for identifying a compound for treating urological disorders e.g., urinary incontinence including overactive/versensitive bladder, overflow urinary incontinence, stress urinary incontinence caused by dysfunction of the bladder, urethra or central or peripheral nervous system, prostatitis, benign prostatic hyperplasia, ancer of the prostate or kidney disorders. The method is also useful for modulating hyperplasia in a cell and treating a subject having a urological disorder. The invention is also used in gene therapy. The present sequence is human kappa opioid receptor 1 (KOR) DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                            The invention relates to a method of determining whether a patient will respond to treatment with a farnesyl transferase inhibitor (FTI), by analyzing the expression of gene that is differentially modulated in the presence of an FTI. The method is useful for determining whether a patient will respond to treatment with a FTI such as (B) 6-[amino(4-chlorophenyl) (1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl)-1-methyl-2-(is)quinolinone, monitoring the therapy of a patient, treating a patient with leukemia with FTI if the analysis indicates that the patient will respond. This sequence corresponds to a gene whose expression may be modulated in the presence of FTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

```
array element in a microarray for monitoring the expression of a number of target polynucleocides. The microarray is particularly useful in the diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is particularly useful in the diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, forcensics and pharmacogenomics. The microarray is also useful for monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, condination is also useful for purifying a subpopulation of mRNAs. Condination is also useful for purifying a subpopulation of mRNAs.

To different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. Alzheimer's disease including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. Alzheimer's disease compart of the printed specification but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           540
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          900

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                  The invention relates to a composition of polynuclectide probes comprising first polynuclectide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynuclectide probes comprising at least a portion of a gene encoding a transducing comprising at least a portion of a gene encoding an effector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynuclectides. The microarray for monitoring the expression of target polynuclectides. The microarray is useful in the control of cancer, an immunopathology or a neuropathology. It can also be used for drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. Microarrays can also be used for monitoring the progression of diseases of that may be associated with the altered expression of signalling pathway polymeptides. The composition can also be used to purify a subpopulation of mRNAs, cDNAs, or genomic fragments in a sample. The expression profile is also useful for the disgnosis and treatment of cancer, e.g. cancers of the adrenal gland, bladder, bone, bone marrow, brain, breast or cervix, an immunopathology, e.g. AIDS, diabetes, pancreatitis, osteoporosis or ulcerative colitis, or a neuropathology, e.g. dementia, amnesia, china polymuclectide probe of the invention. Note: The sequence data for this patent did not form part of the printed specification but was

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠ
                                                                                                           This cDNA sequence comprises the coding region for human kappa opioid receptor (KOR, see AAW30297), a G protein-coupled receptor implicated in neurotransmisation. A novel method for selectively activating a target cell (TC) comprises: (i) introducing into the cell a nucleic acid sequence (I) that expresses a G protein-coupled receptor (A) modified to sequence (I) that expresses a G protein-coupled receptor (A) modified to the transfected cell to small synthetic ligand (RASSL); and (ii) exposing the transfected cell to small synthetic molecules (B) that bind to and activate (A), inducing the G protein-coupled cellular response associated with receptor activated by binding (B) sulficiently to produce the required cellular response. Also new are: (1) transgenic cells including cellular response. Also new are: (1) transgenic cells including cellular response. Also new are: (1) transgenic cells including cellular product. (I) is isolated (II); and (4) transgenic coll including a nimals expressing (A). Activation of (A) results, in vitro or in vivo, in cellular proliferation, or secretion of a cellular product. (I) transgenic animals, including y procedures. Other responses that can be regulated are cell cellular proliferation and contraction, or pigment production. In transgenic animals, expression or stimulation of (A) is designed to develop cardiac migration and contraction, or pigment production. In transgenic animals, certherapy procedures. Other responses that can be regulated are cell migration and contraction, or pigment production. In transgenic animals, certherapy procedures of bone disease, vascular contractions, certransgenic animals are also used for production of emembered feat/lean ratios) or to control fertility or induced labour. A RASSL derived from KOR, designated RASSL OR1 (see AAW10299), was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       240

                                                                                                                                                                                                                 This sequence codes for the human kappa opioid receptor and was obtained from two overlapping cDNA fragments isolated from a human placental cDNA library. The fragments were amplified from the library using FCR primers based on the sequence of human genomic clones which hybridised with a murine delta receptor cDNA probe. Nucleotide probes derived from the humanial receptor coding sequence are useful for diagnosis of neurological, cardio- vascular and psychiatric disorders associated with opioid receptors

| Sequence 1417, Application US/09016434
| Patent No. 650038
| GENERAL INFORMATION:
| APPLICANT: Janice Au-Young
| APPLICANT: Jeffrey J. Seilhamer
| TITLE OF INVENTION: COMPOSITION FOR THE DETECTION OF SIGNALING
| TITLE OF INVENTION: PATHWAY GENE EXPRESSION
| NUMBER OF SEQUENCES: 1490
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: INCYTE PHARMACEUTICALS, INC.
| STREET: 3174 PORTER DRIVE
| CITY: PALO ALIO
| STATE: CALIFORNIA
| COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ZIP: 94304
